Sphingosine-1-phosphate lyase, polynucleotides and modulators

9:

```
while not affecting the growth of non-tumour cells. Mouse and to human SPL polynucleotides (see AAX2566-67) and polypeptides (see AAY05826-29) are claimed. Methods are provided for preparing SPL using transformed or transfected host cells. SPL polypeptides are used in claimed methods for identifying agents that modulate SPL cativity. An SPL inhibitor will inhibit growth of cancer cells. SPL inhibitors (polynucleotides especially breast cancer cells. SPL inhibitors (polynucleotides preventing expression of SPL genes, or antibodies against SPL) can also be used to prevent the development and/or metastasis of cancer, especially where the inhibitor is linked to an antitumour or antiboets receptor antibody. Detection of alterations in an deletion of residues 354-433 of the 568 amino acid human SPL sequence, sepecially where the alteration is a deletion cancer (see also AAY05830), can be used to diagnose cancer, and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sphingosine-1-phosphate lyase (SPL), an enzyme that catalyses the cleavage of sphingosine-1-phosphate into inactive metabolites. Sphingosine-1-phosphate is an endogenous tumour suppressor lipid that potently inhibits breast cancer cell growth and invasiveness,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present sequence represents human endogenous

polynucleotides and polypeptides are useful in gene therapy, vaccines of peptide therapy. The polypeptides have various cytokine-like activities e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, hamunomodulatory activity and activiny, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammanopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activiny inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                 sphingosine-1-phosphate lyase (SPL), an enzyme that catalyses the cleavage of sphingosine-1-phosphate is an endogenous tumour suppressor libid Sphingosine-1-phosphate is an endogenous tumour suppressor libid that potently inhibits breast cancer cell growth and invasiveness, while not affecting the growth of non-tumour cells. Mouse and human SPL polynucleotides (see AAX25666-67) and polypeptides (see AAX05866-29) are claimed. Methods are provided for preparing SPL using transformed or transfected host cells. SPL polypeptides (used in claimed methods for identifying agents that modulate SPL activity. An SPL inhibitor will inhibit growth of cancer cells, especially breast cancer cells. SPL inhibitors (polynucleotides preventing expression of SPL genes, or antibodies against SPL) can also be used to prevent the development and/or metastasis of cancer, especially where the inhibitor is linked to an antitumour
                          or antioestrogen receptor antibody. Detection of alter endogenous SPL sequence can be used to diagnose cancer,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents sphingosine-1-phosphate lyase (SPL), CC as predicted from cDNA (see AAX35570) obtained by amplification of CC human gliobastoma multiforme RNA. The polypeptide sequence lacks CC amino acids 354-433 of SPL (see AAY05827) predicted from a clone CC obtained from fibroblast cells. Sphingosine-1-phosphate is an CC endogenous tumour suppressor lipid that potently inhibits breast CC cancer cell growth and invasiveness, while not affecting the growth CC sequence, especially where the alteration is a deletion of residues CC 354-433 of the 568 amino acid human SPL sequence, can be used to CC diagnose cancer, and to assess the prognosis for recovery. Mouse and CC human SPL polyniclectides (see AAX25866-67) and polypeptides (see CC AAY05826-29) are claimed. The polypeptides are used in claimed methods CC will inhibit growth of cancer cells, especially breast cancer cells. CC They can also be used to prevent the development and/or metastasis CC or anti-cestrogen receptor antibody.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABIL16176-ABIJ0511), expressed DNA sequences (ABIL16176-ABIJ0511), expressed DNA sequences (ABIL16176-ABIJ0511).

The genetically modified organisms or cells are used in screening assays to identify candidate compounds which are potential pesticide agents or therapeutics that interact with subject proteins. The invention also relates to method for studying the biological activity of subject proteins and identifying compounds that have utility as pesticides. The nucleic acids are useful for generating mutant phenotypes in animal models or in living cells that is used for studying the regulation of proteins and use of proteins as pesticides and drug targets. The present sequence is Drosophila melanogaster sphingosine phosphate lyase (SPL) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to Drosophila melanogaster helicase protein, phosphatidylinositol transfer protein (PITP), sphingosine phosphate lyase (SPL) protein and their corresponding nucleic acid molecules. These nucleic acids and proteins are useful for genetically modifying the

                                                                                                                                                                                                                                                                                                                         cleavage of sphingosine-1-phosphate into inactive metabolites. Human sphingosine-1-phosphate is an endogenous tumour suppressor lipid that potently inhibits breast cancer cell growth and invasiveness, while not affecting the growth of non-tumour cells. C. elegans SPL is used in a claimed method for identifying agents that modulate SPL activity. SPL inhibitors will inhibit growth of cancer cells, especially breast cancer cells. SPL inhibitors, including polynucleotides preventing expression of SPL genes, or antibodies against SPL, can also be used to prevent the development and/or metastasis of cancer, especially where the inhibitor is linked to an antitumour or antioestrogen receptor antibody. Detection of alterations in an endogenous SPL sequence can be used to diagnose cancer, and to assess the prognosis for recovery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents Caenorhabditis elegans endogenous sphingosine-1-phosphate lyase (SPL), an enzyme that catalyses the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ρy
                                                                      The present sequence represents Saccharomyces cerevisiae endogenous sphingosine-1-phosphate lyase (SPL), an enzyme that catalyses the cleavage of sphingosine-1-phosphate into inactive metabolites. Human sphingosine-1-phosphate is an endogenous tumour suppressor lipid that potently inhibits breast cancer cell growth and invasiveness, while not affecting the growth of non-tumour cells. Yeast SPL is used in a claimed method for identifying agents that modulate SPL activity. SPL inhibitors will inhibit growth of cancer cells, especially breast cancer cells. SPL inhibitors, including polynucleotides preventing expression of SPL genes, or antibodies against SPL, can also be used to prevent the development and/or metastasis of cancer, especially where the inhibitor is linked to an
                                             antitumour or antioestrogen receptor antibody. Detection alterations in an endogenous SPL sequence can be used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides the protein and coding sequences of a number of apoptosis associated proteins from the yeast Saccharomyces cerevisiae and the fungus Candida albicans. These can be used to identify treatments for fungal and yeast infections, for proliferative diseases and for apoptosis related diseases such as autoimmune diseases, ischaemia and neurodegeneration. The present sequence is one of the S. cerevisiae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Yeast and fungal nucleic acids encoding proteins involved in a pathway leading to programmed cell death, useful for treating proliferative disorders, yeast and fungal infections, or for preventing apoptosis in certain diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; Fig 1; 218pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         proteins of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides the protein and coding sequences of a number of apoptosis associated proteins from the yeast Saccharomyces cerevisiae and the fungus Candida albicans. These can be used to identitreatments for fungal and yeast infections, for proliferative diseases and for apoptosis related diseases such as autoimmune diseases, ischaen and neurodegeneration. The present sequence is one of the C. albicans proteins of the invention.

P. abyssi a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up 110 degrees centigrade.
                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Forterre P,
Querellou J,
                                                                                                                                                                                                                                                                                                                                                                                                     Note: This patent is in the same patent family as WO200065062, contains additional sequences as shown in AAB99132-AAB99143, AAH75903-AAH75920 and AAG66436.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
